

LUXMARINA

The most sophisticated, stylish and ecologically progressive marinas in the world.

LUXMARINA

Remarkable achievements in the design and specification of luxury yachts have accelerated the need for some radical thinking in marina development. LUXMARINA has risen to this challenge with a blueprint for the most sophisticated, stylish and ecologically progressive marinas in the world.

As an established centre of excellence for the yachting and maritime industry, LUXMARINA is dedicated to providing highly advanced solutions for the design, construction and management of ports and marinas worldwide. Now, combining technical superiority and environmental awareness with world leading architecture, engineering and specialist consultancy, LUXMARINA has developed a revolutionary marina concept which is set to change the world of luxury yachting.

With headquarters in France, offices in Lebanon and Qatar, and new branches soon to open in the Middle East, Indian Ocean and Asia, LUXMARINA aims to extend its international commercial reach in order to provide technical design and services solutions to all international maritime requirements.

DESIGN

With its highly creative approach to design, LUXMARINA is changing the perception of a port, or marina, from simply a facility for mooring to a completely new way of life on the water. Created and constructed to the highest technical and aesthetic specifications, each maritime development is specifically designed to blend in with its environment, be it the simplicity of a fishing port or the opulence and grandeur of one of the most luxurious resorts in the world.

LUXMARINA has partnered with internationally acclaimed and award winning architect, Jean Nouvel, to create the first of its signature seascapes, Les Calanques d'Azur. Features include an interface of ultra modern design with natural elements of rock and coral, creating a unique maritime vista. Catering for the niche market of mega yachts from 60m to 160m, it offers a full range of dedicated yachting services, and a vibrant commercial presence, including a Jean Nouvel-designed restaurant and a host of luxury outlets.

MARITIME ENGINEERING SERVICES

Beyond the parameters of port design and creation, LUXMARINA offers a portfolio of services complementing every aspect of marine requirements. The in-house technical team, in close collaboration with maritime engineers, architects and legal consultants, produces technical studies and analysis on issues such as port management and renewable energy solutions - in fact any engineering or environmental study required on the maritime front. Environmental impact studies include the effect of maritime activity on Natura 2000 areas throughout Europe, and support for the European-led study on MEMO (Mediterranean Electronic Marine Highways Observatory) - a marine information and infrastructure system which integrates environmental management and protection systems with maritime safety technologies.

ENVIRONMENT & RENEWABLE ENERGY

The maritime environment needs protection and respect, so the LUXMARINA FOUNDATION has been established to ensure that every aspect of the services in our portfolio meets these criteria. We are dedicated to implementing in our marinas the most advanced solutions for environmental conservation, using natural resources such as wind and solar power for the generation of energy.

ONE-STOP SOLUTIONS

LUXMARINA creates and implements a global management strategy, so that an integrated set of solutions can be driven towards any maritime requirement. Ranging from insurance and reinsurance, yacht and port security, charter and purchase consultation to, most importantly, requirements surrounding flag registration, the One Stop Solution system offers a uniquely customised response to any maritime requirement.

WE CREATE. YOU ENJOY.
